ARTICLE
18 October 2018 | Open Access
Near-atomistic simulations reveal the molecular principles that control chromatin structure and phase separation
Russell et al. introduce CG-1 beta, chemically detailed chromatin model bridging molecular and mesoscale simulations. Using this model, they reveal the molecular principles that control chromatin structure and phase separation.
Hanjie Russell, Yifeng Chen & Michael Gilbert[+3] Russell

ARTICLE
18 October 2018 | Open Access
Cationic chain-anchored monolayer enables wide-temperature composite polymer electrolytes for lithium-metal batteries
Quasi-solid-state batteries are promising candidates for high-energy-density and safe batteries. Here, the authors report a cationic chain-anchored monolayer strategy to construct stable ion transport pathways with robust solid-state interphases, performing well at −20 to 100 °C.
Chaoyi Yang, Yong Zhu & Yanbao Fu[+1]

ARTICLE
18 October 2018 | Open Access
Anti-Kasha fluorescence and persistent room temperature phosphorescence from a nearly flat non-symmetric polycyclic hydrocarbon
Polycyclic aromatic hydrocarbons are efficient emitters, but prohibitively strong π-π interactions usually limit their solid-state luminescence. Here, the authors report a non-symmetric polycyclic hydrocarbon with persistent room temperature phosphorescence.
Yuanyuan Hu, Xiaolong Yang & Zhaohui Wang[+3]

ARTICLE
18 October 2018 | Open Access
Switchable quantum dot photoluminescence across a broad spectrum with all-visible-light activated diarylethene photoswitches
Photoswitchable quantum dot photoluminescence across a broad spectrum with all-visible-light activation is challenging. Here, the authors report a photochromic molecule that enables reversible switching of photoluminescence from blue to red without any overlap. Wei Ji, Yu Fang & Wei Feng[+3]

ARTICLE
18 October 2018 | Open Access
All-accelerated e-catalyst synthesis of nanocrystals for cost-effective photocatalysis
Photocatalysis is a promising technology for sustainable synthesis but is limited by cost. Here, Zhang et al. developed an all-accelerated framework to optimize the TiO2/Ni nanocrystal synthesis under ionic liquid electrolysis, which can be scaled up to 1 kg day−1 with a power consumption of 20 kWh kg−1.
Yifeng Zhao, Yihong Zhou & Xiaoyi Xiao[+1]

ARTICLE
18 October 2018 | Open Access
Molecularly engineered cyclotriazole- fluorinated hydrogel electrolyte for durable Ah-level pilot-size batteries
Aqueous zinc ion batteries promise safe energy storage but suffer from dendrites and side reactions. Here, the authors report a molecularly engineered cyclotriazole-fluorinated hydrogel electrolyte for durable Ah-level pilot-size batteries.
Yuanyuan Li, Yifeng Li & Jiangtao Xiao

ARTICLE
18 October 2018 | Open Access
Head-to-tail assembled borophrenes for solid-state lithium extraction
Extraction of lithium from Li+/Mg2+ brines with chloride- and water is important, but the scalability of membrane technologies is limited by the trade-off between selectivity and flux. Here, the authors report a 2-dimensional boron allotrope-based metallic fluoride-ion selective membrane – borophrene – featuring ultrafast Li+ transport and high Li+/Mg2+ selectivity.
Zhongti Hu, Xiaoyang Liu & Yanbao Fu[+1]

ARTICLE
18 October 2018 | Open Access
Very high frequency (≥5.5 GHz) pulse EPR spectroscopy of high spin transition metal centers
Pulse EPR spectroscopy of high spin transition metal centers is performed within 20 GHz pulse spectrometer. Its performance is assessed by nutation, echo-detected spectra, and relaxation measurements. Results are compared with simulations and flexible geometries and high sensitivity, as shown in a series of high-spin Mn(II) complexes.
Ilia Kaminker, Hannah Goldberg & Daniella Goldfarb

ARTICLE
18 October 2018 | Open Access
Low-contact-resistance and high-current-density n-InAlAs/p-n-type transistors based on oxygen-doped WSe2 monolayers
The performance of complementary logic transistors is limited by the contact resistance of the p-channel. Here, the authors report a p-type transistor based on oxygen-doped WSe2 monolayers with low contact resistance and high-current-density in combination with InAlAs, over 280 cm2 V−1 s−1 contact mobility and a 78.7 fA/μm self-saturation current density.
Yuan Liu, Yuanping Sun & Kai Xu[+1]

ARTICLE
18 October 2018 | Open Access
Phosphor-station tunes electrostatically-driven protein-RNA interactions
Phosphorylation can alter the charge of intrinsically disordered proteins and thereby regulate their interactions with RNA. Here, the authors show that phosphorylation can tune the affinity and specificity of RNA binding by the strong, strong-acid phosphoserine/RNA salt-bridge.
Sarah Keegan, Catherine A Fromm & Yongqiang Cheng

ARTICLE
18 October 2018 | Open Access
High-entropy enabled two-dimensional ferroelectricity and memristive synapses in van der Waals layered materials
Two-dimensional ferroelectrics are often constrained by stringent structural requirements for intrinsic polarization. Here, the authors report high-entropy enabled two-dimensional ferroelectricity and memristive synapses in van der Waals layered materials, offering a potential pathway toward energy-efficient neuromorphic computing.
Meng Xue, Hui Ye & Ni Ni

ARTICLE
18 October 2018 | Open Access
Wide-bandgap perovskites with homogeneous crystallization and suppressed halogen segregation for efficient perovskite-organic tandem solar cells
Wide-bandgap perovskites are crucial for efficient perovskite-based tandem solar cells. Here, the authors report the performance of perovskite devices, the role of dimethylacetamide as the crystallization regulator for homogeneous crystallization, and the suppressed halogen segregation.
Shihong Zhu, Yuanli Duan & Qiang Peng

ARTICLE
18 October 2018 | Open Access
A multifaceted wearable microfluidic platform for non-invasive sweat-mediated monitoring of short-gestation biomarkers
Point sensors are emerging as key tools for preterm-specialists, yet continuous monitoring of biomarkers in sweat remains challenging. Here, the authors report a wearable microfluidic platform for the simultaneous, on-body analysis of sweat biomarkers, which enables continuous, noninvasive monitoring of preterm-associated biomarkers.
Ming Cai, Guang-Yong Ni & Yongsheng Gu

ARTICLE
18 October 2018 | Open Access
Cross-border electricity tariffs undermine power decarbonization, decarbonization and reliability in North America
Analysis on decade of New Hall power market data and simulations show that tariffs on Canadian electricity imports to the United States undermine decarbonization, diminish economic benefits, and weaken grid reliability.
